### Amendments to the Claims

#### Listing of claims

5

Claims 1 – 13 (cancelled)

Claim 14( currently amended ): An apparatus for adjusting a phase difference between  
two input signals, the apparatus comprising:

10

a first buffer for buffering a first input signal and outputting a first output  
signal;

a first DAC for outputting a first control voltage corresponding to a first digital  
value representative of a phase delay;

15

a first variable capacitor coupled to the first DAC and the first buffer, the  
capacitance value of the first variable capacitor corresponding to the first  
control voltage;

a second buffer for buffering a second input signal and outputting a second  
output signal;

20

a second DAC for outputting a second control voltage corresponding to a  
second digital value representative of a phase delay; and

a second variable capacitor coupled to the second DAC and the second buffer,  
the capacitance value of the second variable capacitor corresponding to  
the second control voltage;

25

wherein by controlling at least one of the first and the second digital values, the  
phase difference between the first input signal and the second input signal is  
adjusted, and the first variable capacitor and the second variable capacitor are  
voltage-controlled capacitors.

Appl. No. 10/710,175  
Amdt. dated July 11, 2006  
Reply to Office action of April 11, 2006

Claim 15 ( previously presented ): The apparatus of claim 14 being implemented in a receiver.

5 Claim 16 ( previously presented ): The apparatus of claim 14 being implemented in a transmitter.

Claim 17 ( previously presented ): The apparatus of claim 14 being implemented in a transceiver.

10 Claims 18-19 ( cancelled )

Claim 20 ( previously presented ) : The apparatus of claim 14, wherein the first input signal and the second input signals are clock signals.

15 Claim 21 ( previously presented ) : The apparatus of claim 14, wherein the first input signal and the second input signal are RF signals.

Claim 22 (cancelled)

20 Claim 23 ( currently amended ) : The apparatus of claim ~~[[22]]~~ 14, wherein the voltage-controlled capacitors are MOS-based voltage-controlled capacitors.

Claim 24 ( currently amended ) : The apparatus of claim ~~[[22]]~~ 14, wherein the voltage-controlled capacitors are P+/N well junction voltage-controlled capacitors.  
25

Claim 25 (currently amended) : A method for adjusting a phase difference between

Appl. No. 10/710,175  
Amdt. dated July 11, 2006  
Reply to Office action of April 11, 2006

two input signals, the method comprising:

buffering a first input signal and outputting a first output signal;

buffering a second input signal and outputting a second output signal;

providing at least one of a first digital value and a second digital value

5        representative of a first phase delay and a second phase delay respectively;  
      and

adjusting at least one of a capacitance value of a first variable capacitor with a

first control voltage generated from the first digital value and a

capacitance value of a second variable capacitor with a second control

10       voltage generated from the second digital value, to adjust the phase  
      difference between the input signal and the output signal, wherein the first  
      variable capacitor and the second variable capacitor are voltage-controlled  
      capacitors.

15    Claims 26-27 (cancelled)

Claim 28 ( previously presented ) : The method of claim 25, wherein the first input  
signal and the second input signals are clock signals.

20    Claim 29 ( previously presented ) : The method of claim 25, wherein the first input  
signal and the second input signal are RF signals.

Claim 30 (cancelled)

25    Claim 31 ( currently amended ) : The method of claim ~~[[30]]~~ 25, wherein the  
voltage-controlled capacitors are MOS-based voltage-controlled capacitors.

Appl. No. 10/710,175  
Amdt. dated July 11, 2006  
Reply to Office action of April 11, 2006

Claim 32 ( currently amended ) : The method of claim ~~[[30]]~~ 25, wherein the voltage-controlled capacitors are P+/N well junction voltage-controlled capacitors.

- 5 Claim 33 (previously presented): An apparatus for adjusting a phase difference between an in-phase signal and a quadrature-phase signal, the apparatus comprising:
- a first adjusting circuit, the first adjusting circuit comprising:
    - 10 a first buffer for buffering the in-phase signal and outputting a first output signal;
    - a first DAC for outputting a first control voltage corresponding to a first digital value representative of a phase delay; and
    - a first variable capacitor coupled to the first DAC and the first buffer, the capacitance value of the first variable capacitor corresponding to the first
    - 15 control voltage; and
  - a second adjusting circuit, the second adjusting circuit comprising:
    - a second buffer for buffering the quadrature-phase signal and outputting a second output signal;
    - a second DAC for outputting a second control voltage corresponding to a
    - 20 second digital value representative of a phase delay; and
    - a second variable capacitor coupled to the second DAC and the second buffer, the capacitance value of the second variable capacitor corresponding to the second control voltage;
- 25 wherein by controlling at least one of the first and the second adjusting circuit, the phase difference between the in-phase signal and the quadrature-phase signal reaches a predetermined condition.

Claim 34 (previously presented): An apparatus for adjusting a phase difference

Appl. No. 10/710,175  
Amdt. dated July 11, 2006  
Reply to Office action of April 11, 2006

between a positive signal of a differential signal and a negative signal of the differential signal, the apparatus comprising:

a first adjusting circuit, comprising:

a first buffer for buffering the positive signal and outputting a first output  
5 signal;

a first DAC for outputting a first control voltage corresponding to a first  
digital value representative of a phase delay; and

a first variable capacitor coupled to the first DAC and the first buffer, the  
capacitance value of the first variable capacitor corresponding to the first  
10 control voltage; and

a second adjusting circuit, comprising:

a second buffer for buffering the negative signal and outputting a second  
output signal;

a second DAC for outputting a second control voltage corresponding to a  
15 second digital value representative of a phase delay; and

a second variable capacitor coupled to the second DAC and the second  
buffer, the capacitance value of the second variable capacitor  
corresponding to the second control voltage;

wherein by controlling at least one of the first and the second adjusting circuit,  
20 the phase difference between the positive signal and the negative signal  
reaches a predetermined condition.

Claim 35 (previously presented): A method for adjusting a phase difference between  
an in-phase signal and a quadrature-phase signal, the method comprising:

25 buffering the in-phase signal and outputting a first output signal;

buffering the quadrature-phase signal and outputting a second output signal;

providing at least one of a first digital value and a second digital value

representative of a first phase delay and a second phase delay respectively;

Appl. No. 10/710,175  
Amdt. dated July 11, 2006  
Reply to Office action of April 11, 2006

and  
adjusting at least one of a first variable capacitor and a second variable  
capacitor by respectively utilizing a first control voltage generated from  
the first digital value and a second control voltage generated from the  
5 second digital value, to make the phase difference between the in-phase  
signal and the quadrature-phase signal reach a predetermined condition.

Claim 36 (previously presented): A method for adjusting a phase difference between a  
positive signal of a differential signal and a negative signal of the differential  
10 signal, the method comprising:  
buffering the positive signal and outputting a first output signal;  
buffering the negative signal and outputting a second output signal;  
providing at least one of a first digital value and a second digital value  
representative of a first phase delay and a second phase delay respectively;  
15 and  
adjusting at least one of a first variable capacitor and a second variable  
capacitor by respectively utilizing a first control voltage generated from  
the first digital value and a second control voltage generated from the  
second digital value, to have the phase difference between the positive  
20 signal and the negative signal reach a predetermined condition.

Claim 37 (new): The apparatus of claim 33 being implemented in a receiver.

Claim 38 (new): The apparatus of claim 33 being implemented in a transmitter.

25 Claim 39 (new): The apparatus of claim 33 being implemented in a transceiver.

Claim 40 (new): The apparatus of claim 33, wherein the in-phase signal and the

Appl. No. 10/710,175  
Amdt. dated July 11, 2006  
Reply to Office action of April 11, 2006

quadrature-phase signal are RF signals.

Claim 41 (new): The apparatus of claim 33, wherein the first variable capacitor and the second variable capacitor are voltage-controlled capacitors.

5

Claim 42 (new): The apparatus of claim 41, wherein the voltage-controlled capacitors are MOS-based voltage-controlled capacitors.

Claim 43 (new): The apparatus of claim 41, wherein the voltage-controlled capacitors are P+/N well junction voltage-controlled capacitors.

10

Claim 44 (new): The apparatus of claim 34 being implemented in a receiver.

Claim 45 (new): The apparatus of claim 34 being implemented in a transmitter.

15

Claim 46 (new): The apparatus of claim 34 being implemented in a transceiver.

Claim 47 (new): The apparatus of claim 34, wherein the positive signal and the negative signal are clock signals.

20

Claim 48 (new): The apparatus of claim 34, wherein the first variable capacitor and the second variable capacitor are voltage-controlled capacitors.

Claim 49 (new): The apparatus of claim 48, wherein the voltage-controlled capacitors are MOS-based voltage-controlled capacitors.

25

Claim 50 (new): The apparatus of claim 48, wherein the voltage-controlled capacitors are P+/N well junction voltage-controlled capacitors.

Appl. No. 10/710,175  
Amdt. dated July 11, 2006  
Reply to Office action of April 11, 2006

Claim 51 (new): The method of claim 35, wherein the in-phase signal and the quadrature-phase signal are RF signals.

- 5 Claim 52 (new): The method of claim 36, wherein the positive signal and the negative signal are clock signals.
